

Project Improvement Report

Summary:

In this project we train our model for recognize mountains in text. We use for it about 70-80 labeled sentences with named mountains, but we see that model is not ideal.

In some examples our model can't recognize the mountain entity, or can't recognize all of mountains entities in sentence.

Proposed Solutions:

To fix it we need add more sentences with labeled mountains. And name of mountains need to be placed in different places of this sentences for better model training (in start of sentences, middle, end). We need to feed the model sentences with different numbers of mountains in sentences and then model will be predict all the mountains in sentence.
